KigaliClean - Business Process Explanation

Process: Citizen Reports Dirty Spot

How it starts:

The process starts when a citizen finds a place or an area that is dirty, full of garbage and trash.

What the Citizen does:

The citizen gets the app, logs in, types in the location of that place and takes a picture of that place. That report is automatically sent to the city worker.

What the City Worker does:

The city worker first confirms if that place is really dirty. If NO - the report is rejected / closed. If YES - the city worker sends it to the cleaner.

What the Cleaner does:

The cleaner goes and cleans that place. When the place is clean, the cleaner updates the status to DONE.

How information moves:

Citizen -> City Worker -> Cleaner -> Back to Citizen. The location, photo and status move with the report at each step.

How it helps:

It helps operations because the city knows exactly where to clean instead of guessing. It helps management because they can see which reports are done and which are still waiting.
